Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Silfvast et al. in view of Bateman. Silfvast et al teach an audio mixer comprising an input/output module having two manipulators 99 and 101 in Figure 3A. As taught in column 6 line 8 – column 7 line 47, the input/output module is for a single channel on the mixer, therefore the same audio input channel is assigned to two manipulators. The manipulators, one shown in figure 3E, are aligned with each other with each having a vertical sliding direction. The upper fader 99 and lower fader 101 have volume curves. Silfvast et al do not teach that the faders apply a different manipulative effect on the same audio signal, (i.e. the faders having distinct volume curves). Bateman teach an automatic cross-fading apparatus comprising input fader 30 for adjusting the level of the audio input sources, faders 32 for fading audio output channels and cross-fader 34 for cross fading the output channels. Fader 30 adjusts the signal from +6 db to total attenuation, while fader 32 adjusts the signal from 0 db to total attenuation, thereby having different volume curve. Therefore, it was well known to have an two faders with a different volume curve and it would have been obvious to one of ordinary skill in the art at the time of invention to use the teachings of Bateman in the invention of Silfvast.
